

macOS TCC Bypass

Ricardo Løgan

Security Specialist with extensive experience in enterprise networks and enthusiastic on malware research, pentest and reverse engineering. I have been focused in the last years in research for vulnerability and malware for macOS environment.

I am part of the staff for some security conferences organizations such as H2HC (Hackers to Hackers Conference), BsidesSP and SlackShow/Slackzine Community.

Gatekeeper

TCC

SSV

0x02 Bypass TCC

TCC(Transparency, Consent and Control) – Included in macOS since version 10.11 El Capitan

A bypass in macOS TCC is dangerous because it can compromise privacy, security, and system integrity by allowing apps or process to access sensitive resources without consent.

```
### TCC (Privacy Protections)
```

```
~/Desktop
```

```
~/Documents
```

```
~/Downloads
```

```
iCloud Drive
```

```
etc...
```

```
### TCC (Not Protected)
```

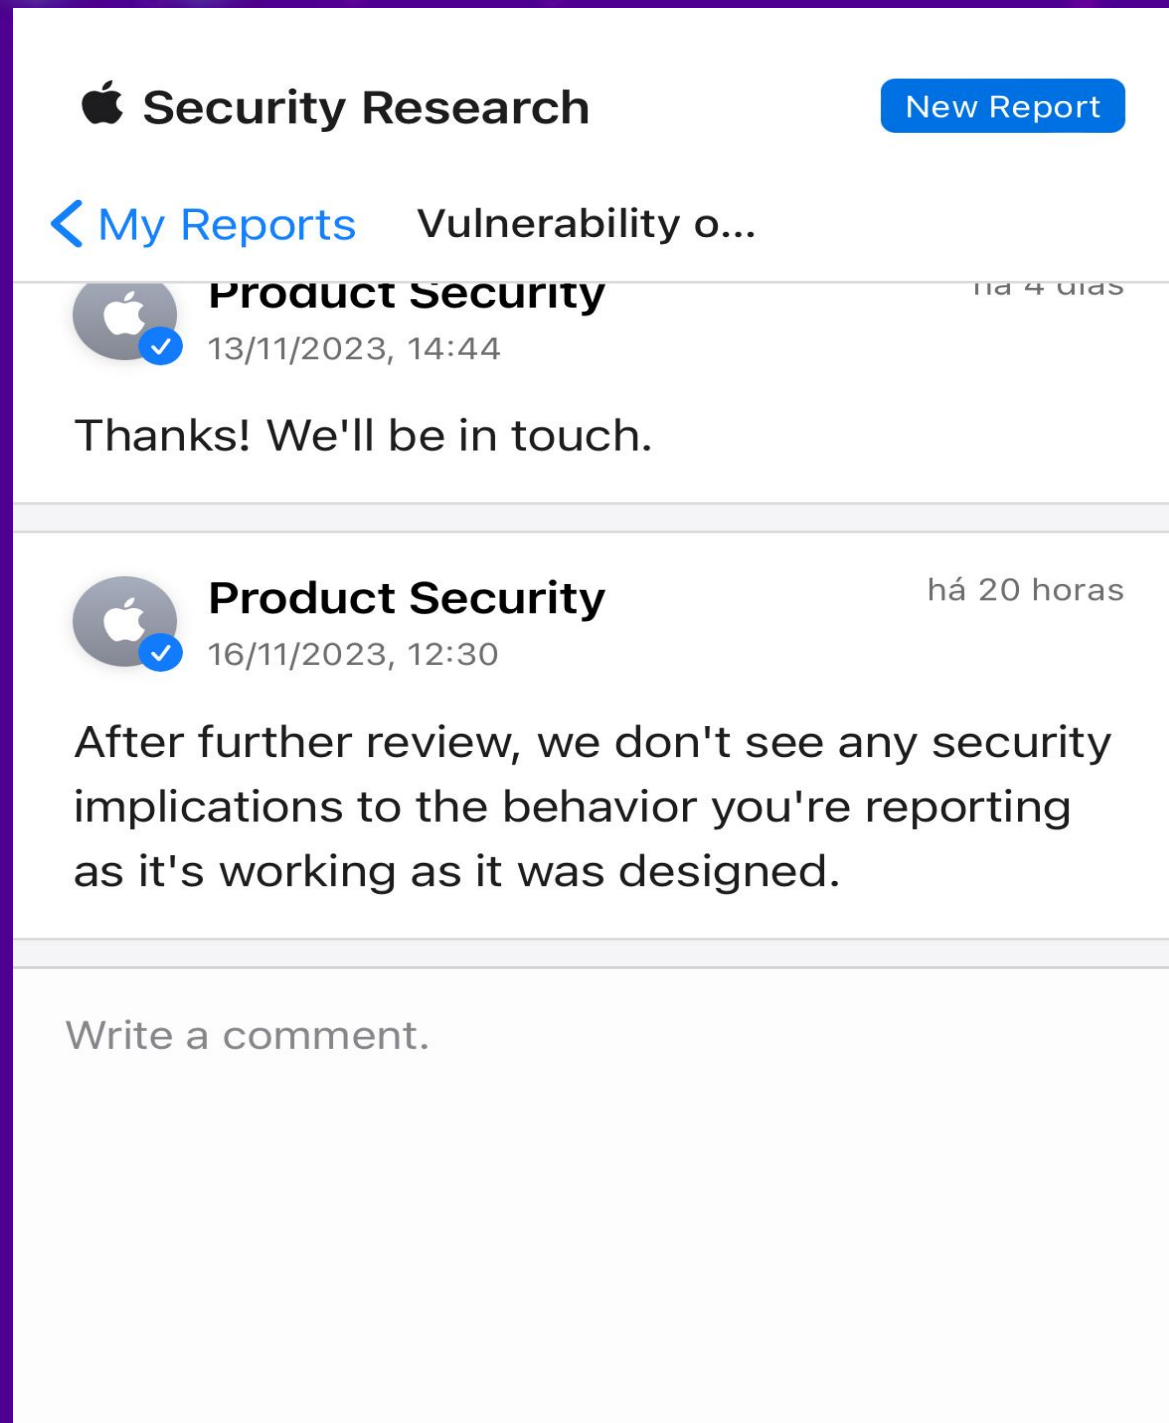

```
/tmp
```

```
~/.ssh
```

0x02 Bypass TCC

Vulnerability found on TCC (Transparency Consent and Control)

- Access and modify of files protected by the system (TCC+ SSV+SIP).
- Bypass TCC component in macOS does not validate the use of the "open ." the command must block the access to the folder from the terminal to the finder.

Risk:

Drop file with new TCC.db with a malicious entry to disable some security protections that could be explored by another binary (like malware).

Resolution:

In my opinion, TCC.db should have a flag created in the operating system based on the hardware and the operating system to ensure that it should not be possible to rewrite TCC.db by an installation generated by another machine.

0x02 Bypass TCC

0x02 Bypass TCC

POC ->

0x03 Conclusion

- Are your SOC and Blue Team monitoring and protecting the company from attacks?
- Are the controls really effective and well implemented?
- Are your systems updated and with last security patches?
- Do you make security tests (Pentest) recurrent in your macOS endpoints?
- Do you have a well oriented team or update service with the last published vulnerabilities?

"A motivated attacker achieves his goal regardless of time"
